ProjectfordissertationM.Pharm:

1.Swellablecontrolleddrugdeliverysystems.

Studied and developed a better swellable controlled drug delivery system by swelloimbibing, highly water soluble drugs (PROPONOLOL HYDROCHLORIDE AND DICLOFENAC SODIUM). Worked on developing a pulsating drug release system with PROPANOLOL HYDROCHLORIDE, so it can be used for TEMPORAL drug delivery systems.

ProjectTitleforPh.D:

1. **SelfEmulsifyingDrugDeliverySystemsforPoorlySolubleDrugs.**

A large number of new drug products have solubility problems. They are poorly water soluble and have very less bioavailability. To overcome solubility problems several traditional method are adopted. Recently self emulsifying drug delivery systems (SEDDS or SDS) are introduced to improve the solubility of poorly soluble drugs, which in turn increases the oral bioavailability of drugs.

SEDDSaremixtures ofoil, surfactantsandco-solvents or co-surfactants. Oilcanbesynthetic or naturalsource, surfactants can besolids or liquids, co- solvents or co-surfactants can besingle or multiple solvents. TheseSEDDS should form oil-in-water emulsions or Self micro-emulsifying drug delivery systems (SMEDDS) and these formulations pass through stomach easily. Once they reach stomach, availability of drug will be more in GI tract. These formulations reduce stomach side-effects like irritation, nausea etc., because the drug is in soluble form in lipid based systems. These preparations are stable, easy to prepare and good partitioning between oil and water.
